

ABSTRACT

A system for remote consultation via a remote mobile communication apparatus has a unit of medical equipment, a medical server and a remote mobile communication apparatus. A method for remote consultation employs the medical equipment to produce the first medical report and store it into the medical server, transmits the first medical report with the medical server to the remote mobile communication apparatus via a wireless communication network, browses the first medical report, increases, modifies or varies the medical image or medical text of the first medical report to form the second medical report, and uses the mobile communication apparatus to send the second medical report back to the medical server via the wireless communication network. The remote consultation can be reached.
